

Cultural Analytics of Gender Representation in Film: A James Bond Case Study

Jakob Lambert-Hartmann

2025

Motivation: Indiana Jones

- Indiana Jones:
 - “Tough guy”
 - Fearless
 - Gets what he wants
- Female Characters:
 - Love interest
 - Always afraid
 - Hysterical

Research Question: When Did This Change?

- When did this change?
- Was it a gradual change or a sudden one?
- Is change correlated to some events/movements?
- Is change observable with AI tools?

Corpus: James Bond 50th Anniversary Collection

- Long-running franchise: 1962-2008
- Near infinite amount of movies (22) with:
 - almost same crew
 - almost same cast
 - almost same plot
- Bonus: maybe I can deduce the cost from taxes later

Methods

1. **“Privatkopie”:**
DVD → usable format (VLC)
2. **Scene detection:**
movies → scene-frames
(PySceneDetect)
3. **Person detection:**
scene-frame → persons (YOLO)
4. **Trait/gender detection:**
person → trait + gender (CLIP)
5. **Plotting:**
data → nice plots (matplotlib)

Scene Detection:

Person

Detection:

Trait/Gender

Detection:

Gender:

A picture of a man
A picture of a woman

Characteristics:

Is the person strong?
Is the person hysterical?
Is the person sexualized?
Is the person afraid?

Limitations

1. Bias in models
2. James Bond may not be representative of other movies
3. Only visual aspects of movie (but Bond is not subtle)

Thanks! Input? Feedback?
